December 2023

SEMCOG's 2050 Forecast of School-Age Population

The SEMCOG Regional Forecast is critical to understanding the changing regional and local demographics of Southeast Michigan. This year, SEMCOG adopted its 2050 demographic and economic forecast and subsequently released an interactive web tool, the 2050 Regional Development Forecast Explorer, which allows users to explore changing demographic trends in the region for six age groups at multiple geographic levels.

This report, along with SEMCOG's Forecast Explorer (<https://www.semcoq.org/regional-forecast>), present an in-depth analysis of forecasted changes in the region's school-age population (children aged 5 to 17). This analysis helps local school districts, communities, and other data users to better understand the changing dynamics of that population group over the next 30 years as well as their impacts on K-12 education in the region. This report illustrates the following trends for Southeast Michigan:

- The continued aging of the region
- Fewer births in the region
- Migration as a driving factor in population change
- Local trends impacting school districts

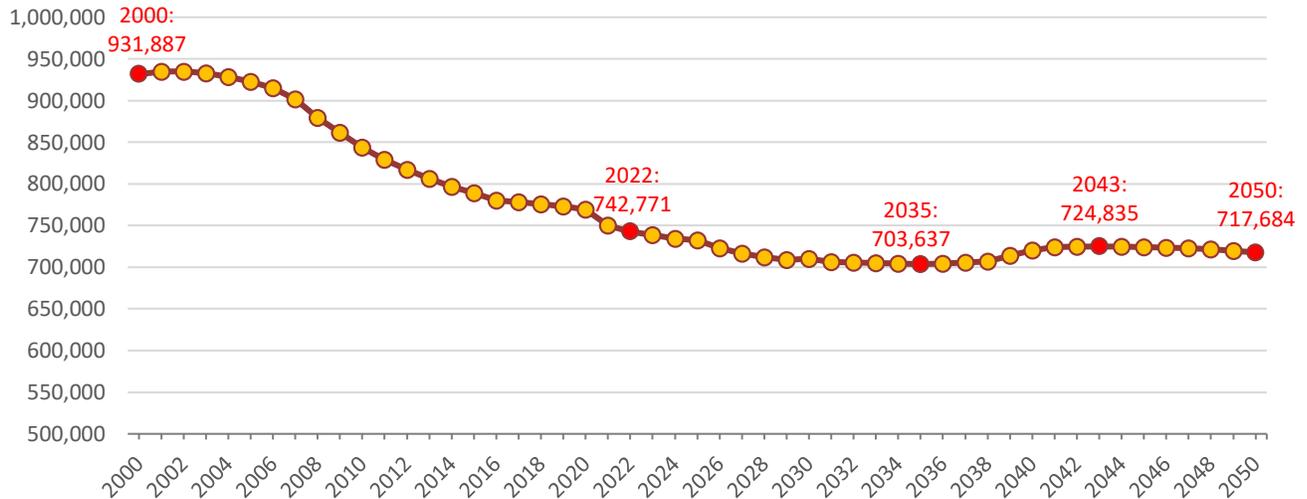

Southeast Michigan's school-age population: Past, present, and future

In 2000, there were nearly 932,000 school-age children in Southeast Michigan. The number decreased to 743,000 by 2022, a decline of 20%. This number is projected to decrease even further to 710,000 by 2030 and to 704,000 by 2035, another 5% decline. After 2035, school-age population is expected to stabilize and stay relatively unchanged for few years before experiencing small increases beginning in 2039 and reaching a peak of 725,000 children in 2043. By 2050, there will be nearly 718,000 school-age children in the region, a mere 2% increase from the low of 2035 and a 3.5% decrease from the 2022 levels (Figure 1).

\$4,620,800	\$3,942,100	\$678,500	15%
\$324,400	\$260,700	\$63,700	20%

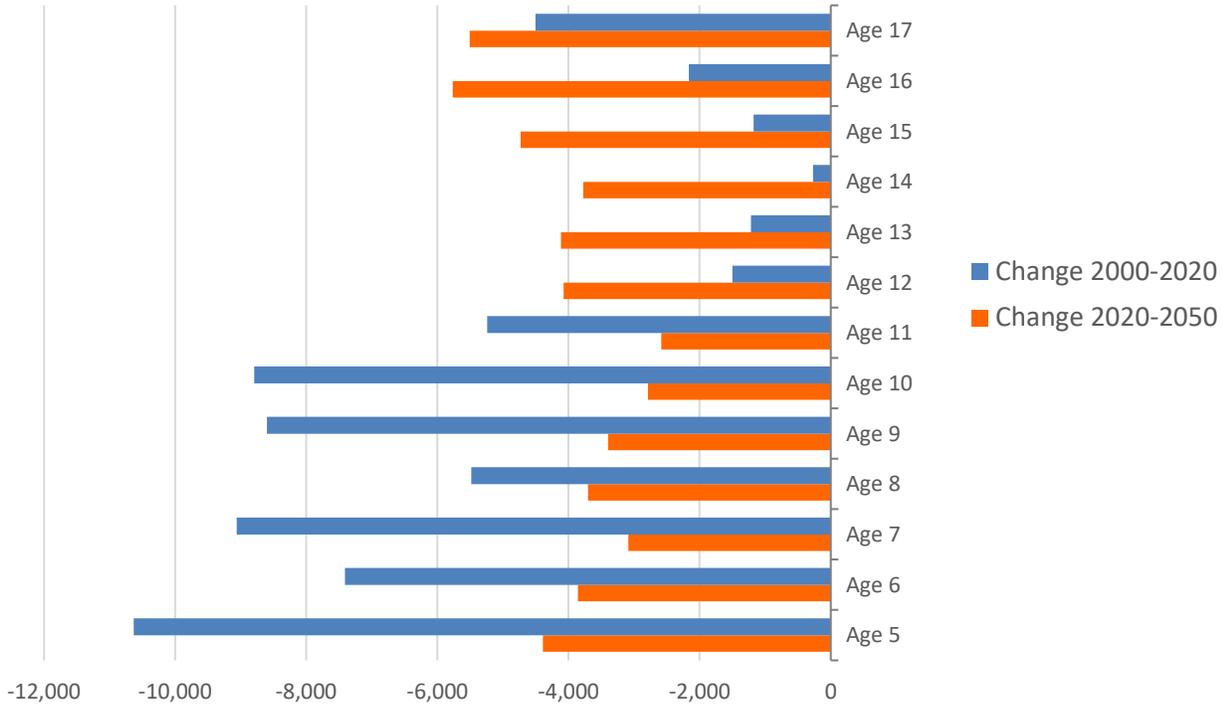

Figure 1

Southeast Michigan's school-age population (ages 5-17), 2000-2050

While the decline in school-age population will slow and stabilize in the coming decades, changes among individual ages will continue to transform our schools. During the past two decades, the region witnessed a dramatic decline in elementary school-age children (Figure 2). However, going forward, as kids in lower grades move into higher grades, high schools in the region will witness more population losses, although less severe than the record losses in younger cohorts observed in the recent past.

Figure 2
Change in school-age population by single year of age, 2000-2020 and 2020-2050

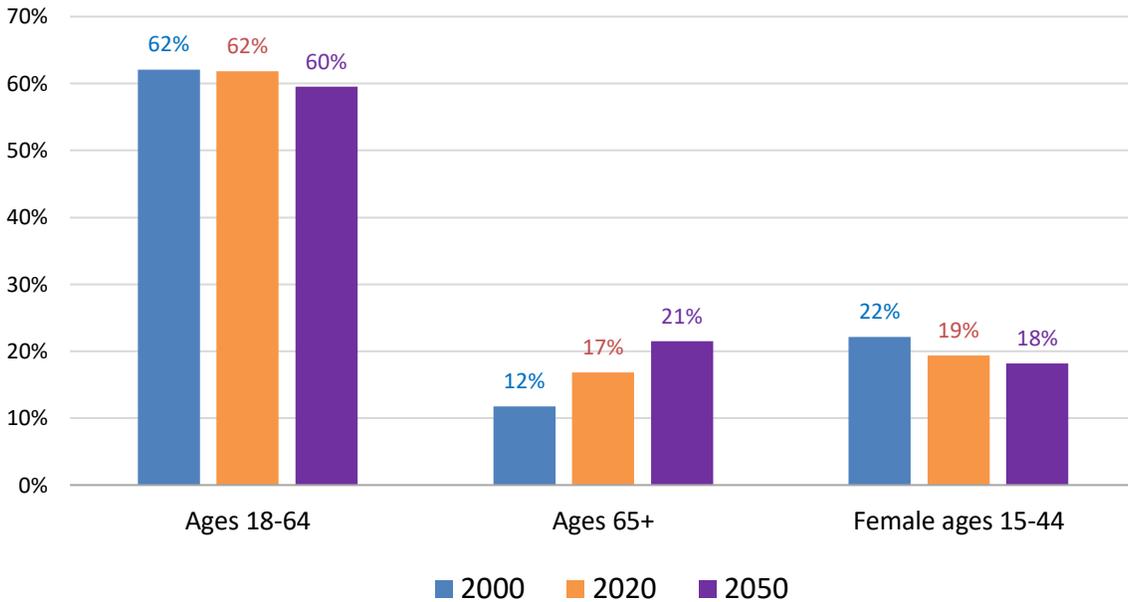

The negative trends in the region’s school-age population are driven by three factors: overall aging of our population, declining birth rates, and net domestic out-migration from the region.

The region continues to age

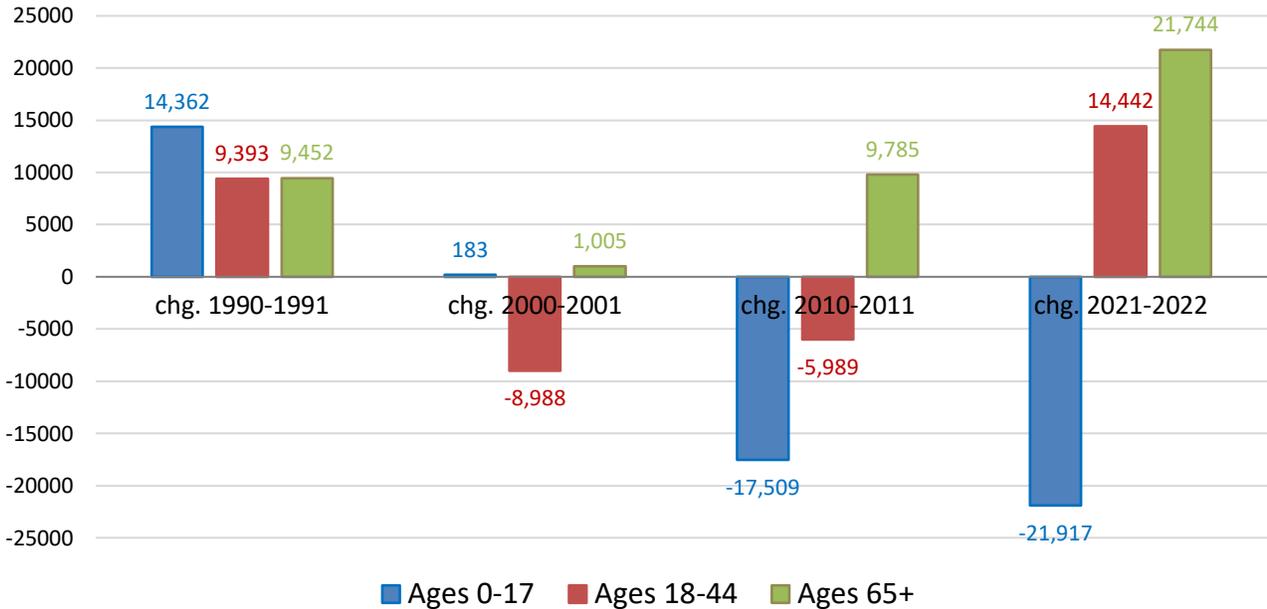

Southeast Michigan, along with the nation, faces an aging baby boomer population. Its influence on demographic trends continues to affect various age groups. While the baby boomers are driving the dramatic increases in senior age groups, the shares of working-age population (aged 18 to 64) and women of childbearing age (aged 15 to 44) are declining (Figure 3).

Figure 3
Demographic shifts by select age group, Southeast Michigan, 2000, 2020, 2050

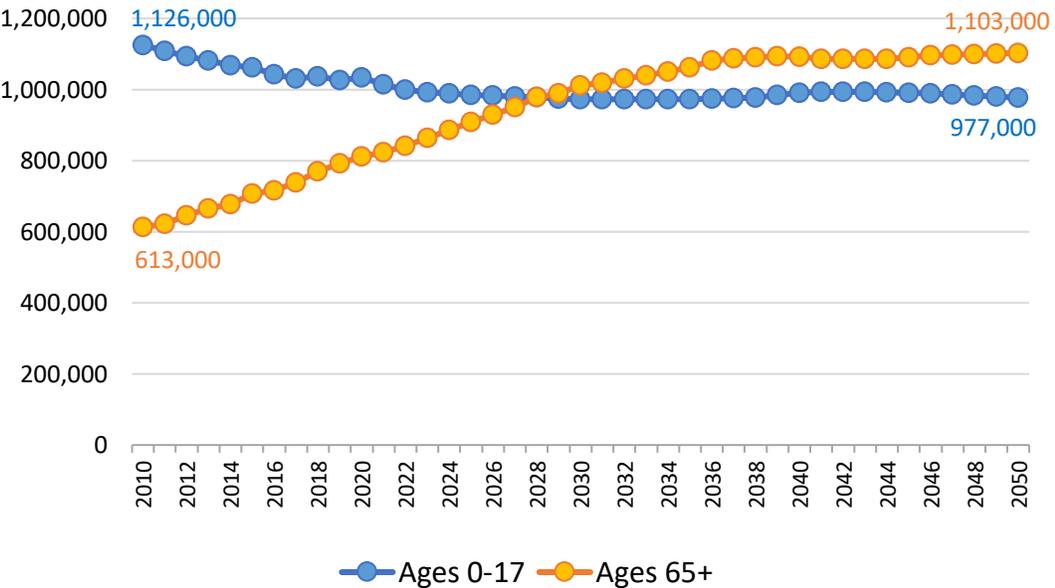

During early 1990s, children under 18 made up a significant portion of annual population growth in the region and exceeded the growth of the child-bearing and senior age groups (Figure 4). By the turn of the century, the pattern had changed, with hardly any growth in child population in 2001, and a large loss in 2011, when the region lost more than 17,000 people under age 18. The population aged 18 to 44 also decreased during 2000-2001 and 2010-2011 periods. As the baby boomers began to enter 65+ age group in 2011, growth in senior population increased by more than 9,000. By 2022, growth in the senior population accelerated to over 21,000 per year.

Figure 4
Annual change in population by age group, Southeast Michigan

As more baby boomers enter senior years and fewer people will be in the childbearing ages, there will be continued decrease in the child population. Year 2028 marks an important turning point in the region, when nearly the entire baby boom generation will be 65 years or older and the child population is projected to be outnumbered by the senior population for the first time (Figure 5).

Figure 5
Growth trends in child (0-17) and senior populations (65+), Southeast Michigan, 2010-2050

\$4,620,800	\$3,942,100	\$678,500	15%
\$324,400	\$260,700	\$63,700	20%

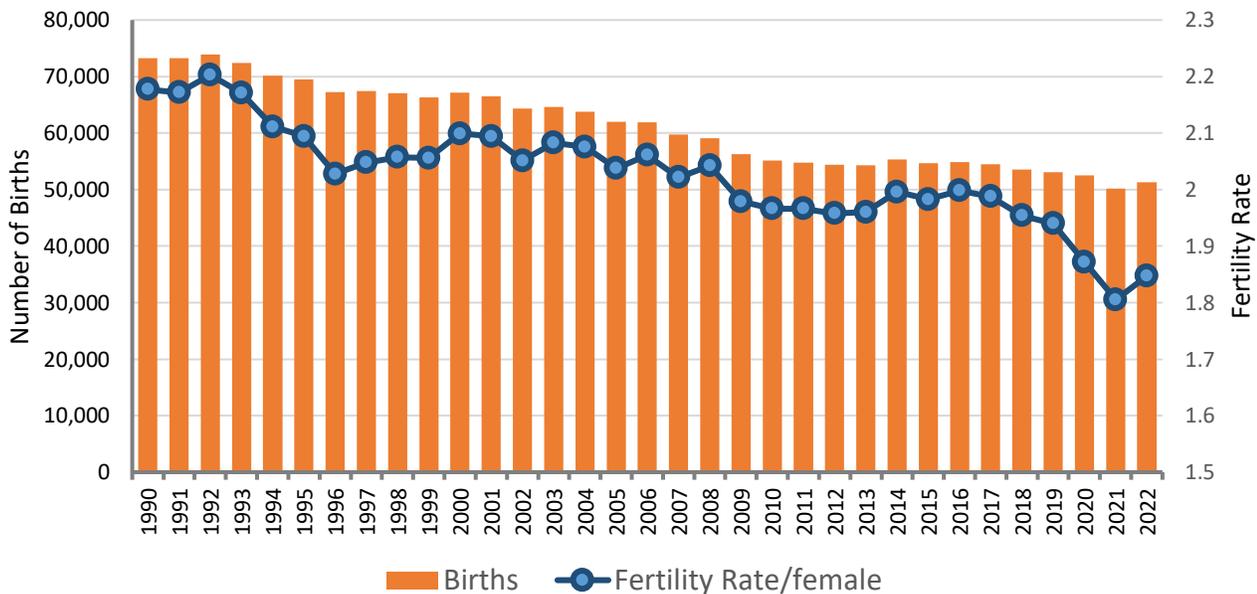

Fewer babies are born in the region

Birth rates and fertility rates among women have also been dropping in the region, reducing the level of natural increase in population. Birth rates measure the number of live births per 1,000 people in a year. The region's birth rate has decreased from 15.95 in 1990 to 10.74 in 2022. Between 2015 and 2020, there were an average of 53,800 births per year in the region, down from 72,100 annual births between 1990 and 1995 (Figure 6).

Fertility rate measures the average number of children born to a woman throughout her childbearing ages (ages 15 to 44). The region's fertility rate was 2.18 births per woman in 1990, slightly above the replacement rate of 2.1 needed to maintain a stable population without migration. Fertility rates have been on the decline and now are much below the replacement level. In 2022, the fertility rate among region's 15-to-44-year-old women was 1.85, well below the needed population replacement rate.

Figure 6

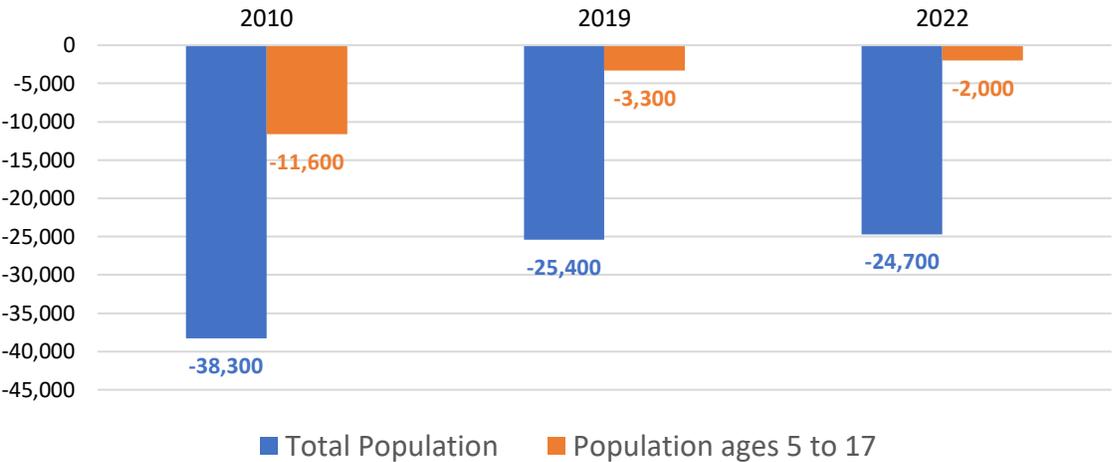

Number of births and fertility rates, Southeast Michigan

Migration will be the driving factor in population change

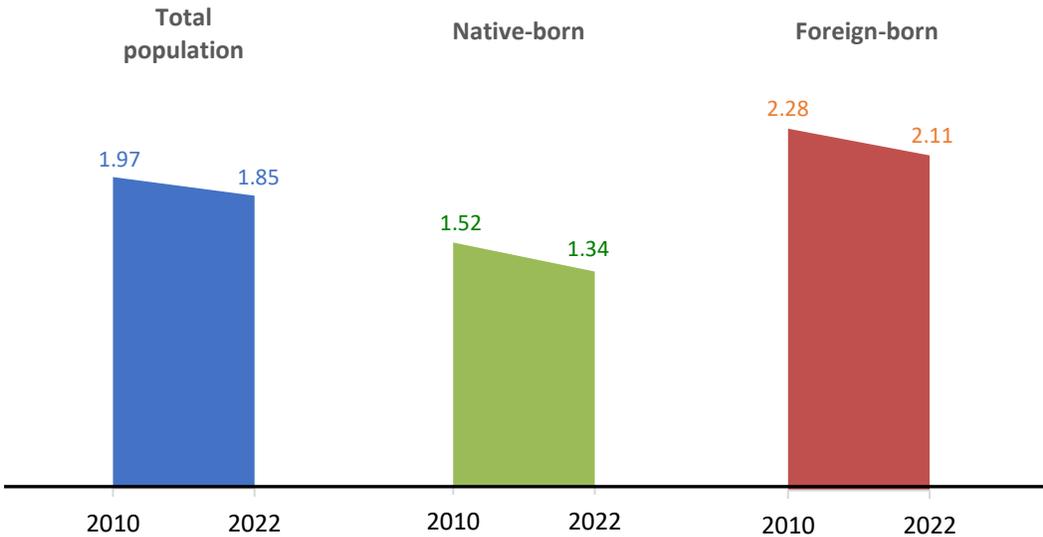

As the fertility rate remains under the population replacement rate, migration is now the driving factor for population growth, including school-age population. Much of loss in child population in the past decade can be attributed to migration of people out of the region. In 2010, the region lost about 38,300 people to net domestic out-migration, of whom 11,600 people (or 30%) were school-age children. The rate of outmigration from the region is slowing because of an improved economy since 2010. In 2019, the region saw about one-third reduction in net outmigration compared to 2010, losing 25,400 people. Of these, 3,300 (or 13%) were school-age children. In the wake of the COVID-19 Pandemic, domestic outmigration continues to influence the region's population. In 2022, the region lost 24,700 people to domestic outmigration, 2,000 of whom were children aged 5-17 (Figure 7).

Figure 7
Net domestic migration, Southeast Michigan

While domestic migration has been negative for decades in Southeast Michigan, international migration has always contributed to population growth. Furthermore, birth rates are higher for immigrant populations. Since 1990, much of the downward trend in the number of births in the region is driven by native-born women. While the fertility rates are trending downward for both native-born and foreign-born women (aged 15 to 44), foreign-born women have, on average, higher fertility rates than native-born women (Figure 8).

Figure 8
Fertility rate by nativity

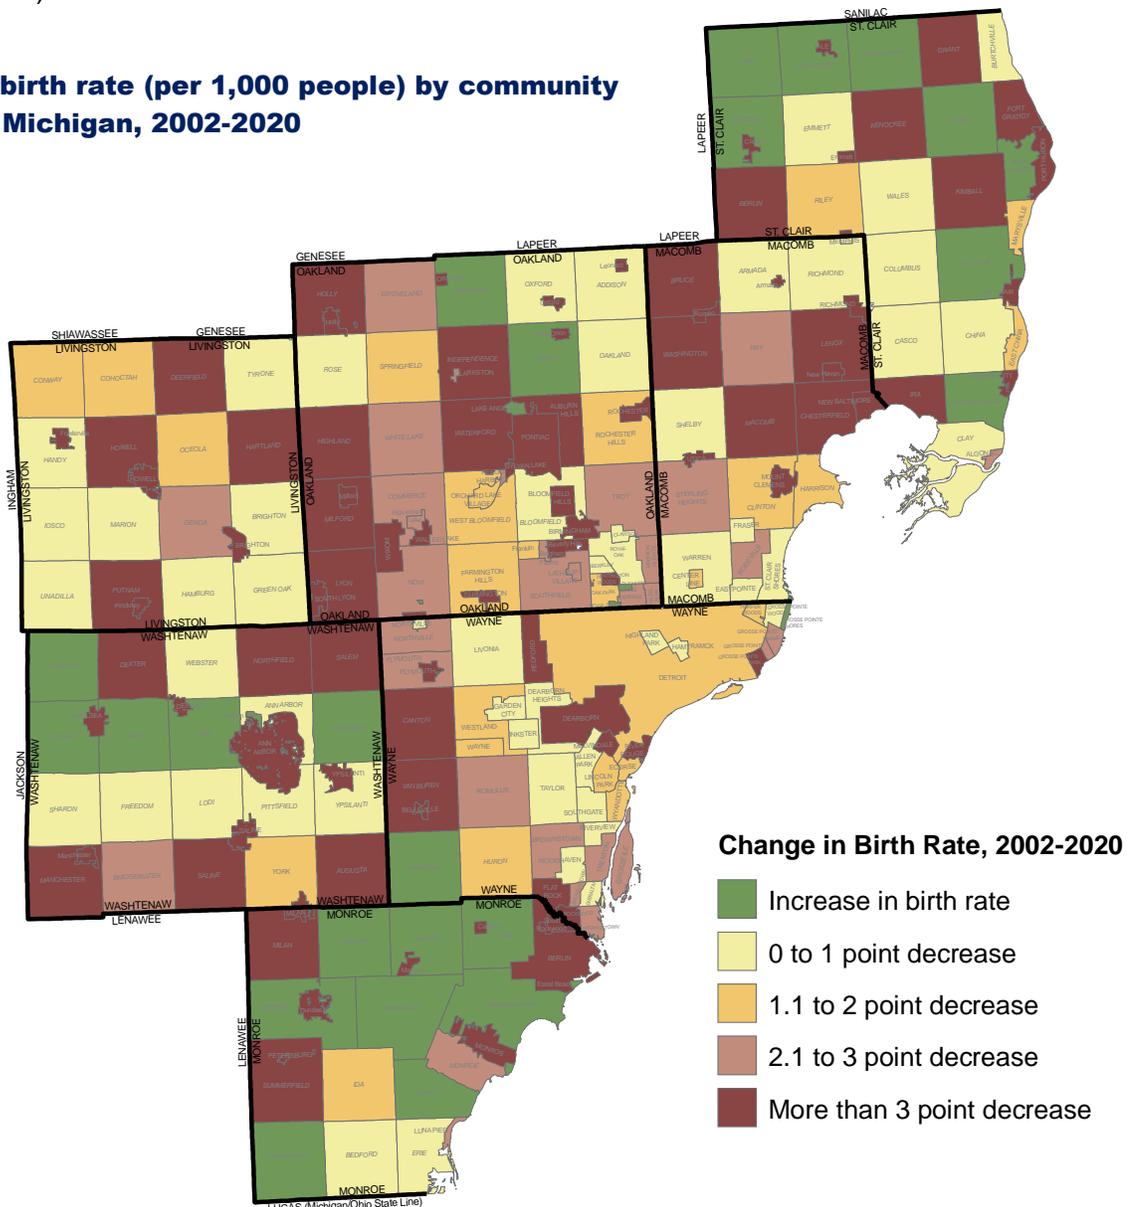

\$4,620,800	\$3,942,100	\$678,500	15%
\$324,400	\$260,700	\$63,700	20%

With our aging population and declining fertility rates, migration into the region – international and domestic – will be the main contributing factor to stabilization and growth in school-age population in the future.

Local trends impacting school districts

While the region is witnessing the trends of an aging population and reduced birth rates, the patterns differ among individual communities and school districts. Many suburban and rural communities are seeing greater reductions in birth rates compared to urban, inner-ring communities. Nearly three quarters of communities (171 out of 233) in the region saw a decrease in birth rate between 2002 and 2020 (Figure 9).

Figure 9
Change in birth rate (per 1,000 people) by community
Southeast Michigan, 2002-2020

Source: SEMCOG analysis of Michigan Department of Community Health vital statistics data

From 2020 to 2035, all intermediate school districts (ISDs) in the region will see additional declines in school-age population. After 2035, all districts - excepting Monroe ISD and Wayne Regional Education Services Agency (Wayne RESA) – are projected to experience small gains in school-age population. By 2050, all ISDs in the region, except for Livingston Educational Service Agency (Livingston ESA) and Washtenaw ISD, will have lower populations of school-age children than the levels observed in 2020.

Following are the forecast changes in school-age population in each of the seven ISDs in the region for the next 30 years:

- Livingston ESA – gain of 2,900 (+11%)
- Macomb ISD – loss of 5,800 (-4%)
- Monroe ISD – loss of 3,200 (-13%)
- Oakland Schools – loss of 2,900 (-1%)
- St. Clair ISD – loss of 2,800 (-12%)
- Washtenaw ISD – gain of 200 (+0.3%)
- Wayne RESA – loss of 39,600 (-13%)

At the individual school district level, all but 11 of the 112 school districts in the region are forecast to experience declines in school-age children between 2020 and 2035 (Figure 10). After 2035, Most districts will see some modest gains in school age children (Figure 11).

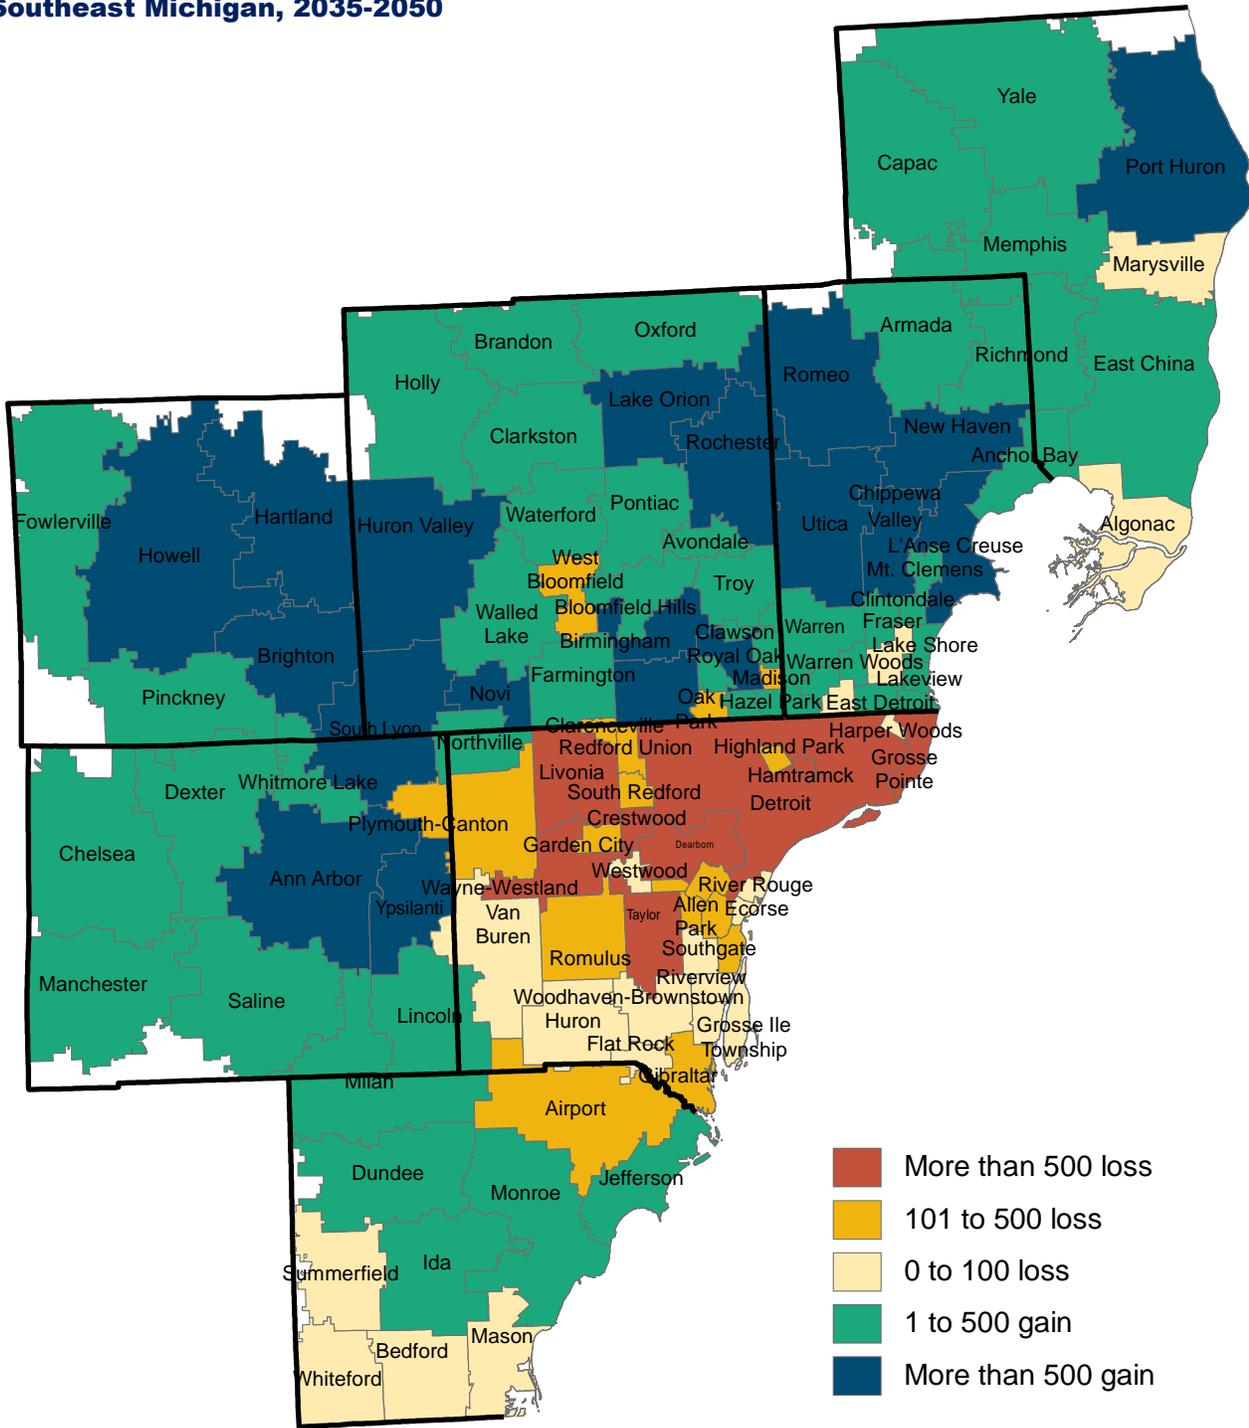

Conclusion

School districts across Southeast Michigan have been grappling with the declining enrollments for several years and will continue to see additional declines for several more years into the future. However, the trends going forward will be less dramatic. The subsequent growth in the future will be modest due to several demographic factors. These include an aging population, declining birth rates, and lack of in-migration. These competing trends will provide many challenges to school districts in their facility and program planning.

These shifting age dynamics will require local communities to focus their planning efforts beyond school grounds. As most of these places are also the ones that are either experiencing rapid increases in senior population or already have larger share of senior populations, communities will be required to put greater emphasis on planning for infrastructure and services that will cater to the aging population but also retain and attract younger populations.

Accessing the data

Table 1 provides SEMCOG's 2050 school-age population forecast by individual school district. Additional data by each school district can be accessed through SEMCOG's interactive Forecast Explorer tool located at <https://maps.semcoq.org/forecast>.

This map allows users to view SEMCOG's detailed long-range forecast of population and households for each ISD and school district in the seven-county Southeast Michigan region. In addition to viewing the forecast data in map form, one can also view a detailed report of total population, population by age cohort, and household change for each district in the region.

Additional notes:

- A school district is defined as each public school district that is a member of the larger intermediate school district agency (ISD) associated with each of the 7 counties in Southeast Michigan. In total, 112 public school districts are members of the 7 county ISDs.
- Of the 112 public school districts, 8 span across the boundary of the Southeast Michigan region:
 - Fowlerville Community Schools in Livingston County;
 - Whiteford Agricultural Schools in Monroe County;
 - Brandon School District and Oxford Community Schools in Oakland County;
 - Capac Community School District and Yale Public Schools in St. Clair County; and
 - Chelsea School District and Manchester Community Schools in Washtenaw County.
- While a large majority of these districts are within the region, the forecast results for these districts includes only the portion of the district within the SEMCOG region.
- An additional 16 public school districts that are members of county ISDs located outside the region cover parcels within the region. SEMCOG does not produce forecast results for these districts as only a small percentage of these areas are within the region.
